

ENVIRONMENTAL POLICY

At MC Pipes we believe that we have a responsibility to care for and protect the environment in which we operate. We conduct all operations with a view to keep our environmental impact to a minimum, whilst continually endeavouring to improve our environmental performance.

MC Pipes has recently invested in a state of the art pipe manufacturing facility which was custom built specifically for our needs. This has enabled us to streamline operations, effectively reducing on site cartage, energy and water consumption. We have also invested in two state of the art pipe making machines which allow us to produce superior quality products with minimum energy consumption. These machines have a low noise level and offer fully automated production, allowing us to reduce waste and control resources efficiently.

At MC Pipes, we always aim to comply with regulatory standards concerning the environment. We continually work to develop solutions that reduce waste, minimise any lifecycle impacts and meet community aspirations for a sustainable future. Within our operations we;

- Identify and manage environmental risks within our operations through regular toolbox meetings
- Apply best practice principles to the prevention of pollutions
- Remove any hazardous waste safely through waste removal companies
- Recycle rain water via two 22,000L water tanks
- Recycle waste concrete mix and use to relay the yard
- Continually work towards minimising the environmental impact of our manufacturing process
- Use natural resources responsibly
- Communicate this policy to all employees to ensure they understand and comply satisfactorily

MC Pipes will periodically review performance in these areas.
